

# JR-Capture

## .net dll

**.net** JRCapture .NET dll JRCapture .NET dll

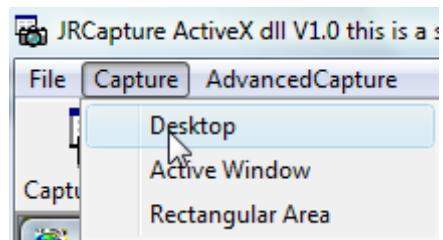

insert screen capture functions with a couple of line of code.

The controllib is designed for use with all .net IDE's.

If you need the older  version load it from [www.jrsoft.de](http://www.jrsoft.de).

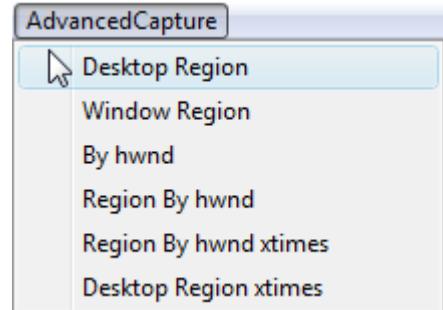

## Features:

- ▣ Capture Desktop.
- ▣ Capture active window.
- ▣ Capture area.
- ▣ Capture client area.
- ▣ Capture delayed.
- ▣ Capture with and without mousepointer.
- ▣ Capture with sound.

## Advanced Features:

- ▣ Capture desktop area.
- ▣ Capture window area.
  
- ▣ Capture in use of object handle (hwnd).
- ▣ Capture are in use of handle.

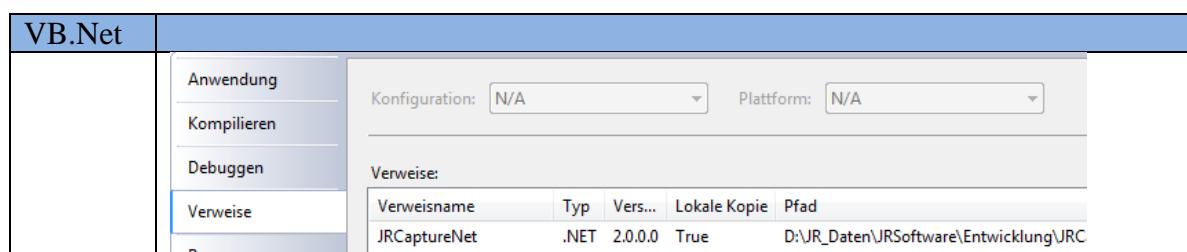

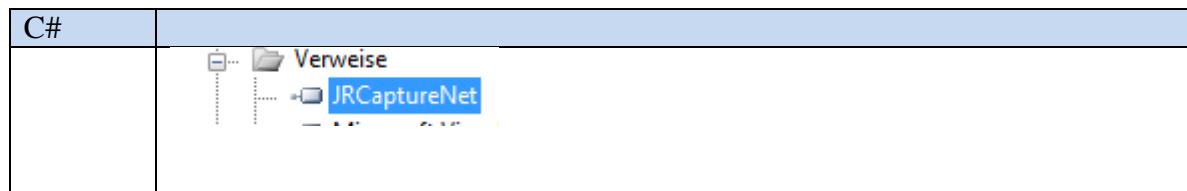

Auch diese Funktionen wahlweise mit oder ohne Mauszeiger.

- ▣ Beide Controls sind signiert. (Wichtig wenn Sie Ihre Endanwendung zertifizieren lassen wollen).
  
- ▣ Jeweils mit Demoprojekt in C# und VB.net

## Make it running:

Set a reference in your system to JRCaptureNET.dll

Create a new JRCapture object

C#	<pre>Dim JRCapture As New JRCaptureNet.Capture</pre>
----	--

VB.Net	<pre>Dim JRCapture As New JRCaptureNet.Capture</pre>
--------	--

## Now its easy to make copy of screen items:

### Copy the complete desktop as follows

C#	
	//capture Desktop JRCapture.CaptureDesktop(); PictureBox1.Image = JRCapture.Picture;

VB.Net	
	'capture Desktop JRCapture.CaptureDesktop() PictureBox1.Image = JRCapture.Picture

### The active window

C#	
	//capture active Window PictureBox1.Image = JRCapture.CaptureWin();

VB.Net	
	'capture active Window PictureBox1.Image = JRCapture.CaptureWin

### A area created with the mouse

C#	
	//capture rectangel area if (JRCapture.CaptureArea() != null) { PictureBox1.Image = JRCapture.Picture; }

VB.Net	
	'capture rectangel area If Not IsNothing(JRCapture.CaptureArea) Then PictureBox1.Image = JRCapture.Picture End If

### Or an object from his handle

C#	
	//capture a Object or Window by his handle PictureBox1.Image = JRCapture.CaptureByHWND((long)your.Handle);

VB.Net	
	'capture a Object or Window by his handle PictureBox1.Image = JRCapture.CaptureByHWND(your.Handle)

## Work with the captured PictureObject:

Do anything with it or use the save function

C#
JRCapture.Save(Application.StartupPath + "test.png"); JRCapture.Save(Application.StartupPath + "test.bmp");

VB.Net
JRCapture.Save(Application.StartupPath & "test.png") JRCapture.Save(Application.StartupPath & "test.bmp")

## Capture Settings:

The capture functions uses the following settings

C#
JRCapture.PlaySound = true /false;
JRCapture.CaptureOnlyClientArea = true /false;
JRCapture.CaptureMouseCursor = true /false;
JRCapture.CaptureDelayMs = long value;
JRCapture.CopyToClipboard = true /false;

VB.Net
JRCapture.PlaySound = true /false
JRCapture.CaptureOnlyClientArea = true /false
JRCapture.CaptureMouseCursor = true /false
JRCapture.CaptureDelayMs = long value
JRCapture.CopyToClipboard = true /false

# Advanced Capture Functions

## Copy an area of the desktop

C#	
	<pre>//capture a region of the Desktop  //define the region to capture JRCapture.CaptureRegionHeight = 400; JRCapture.CaptureRegionLeft = 300; JRCapture.CaptureRegionTop = 200; JRCapture.CaptureRegionWidth = 400;  //activate the region capture tool JRCapture.CaptureRegion = true; PictureBox1.Image = JRCapture.CaptureDesktop(); //deactivate the region capture tool JRCapture.CaptureRegion = false;</pre>

VB.Net	
	<pre>'capture a region of the Desktop 'define the region to capture JRCapture.CaptureRegionHeight = 400 JRCapture.CaptureRegionLeft = 300 JRCapture.CaptureRegionTop = 200 JRCapture.CaptureRegionWidth = 400  'activate the region capture tool JRCapture.CaptureRegion = True PictureBox1.Image = JRCapture.CaptureDesktop() 'deactivate the region capture tool JRCapture.CaptureRegion = False</pre>

## Copy an area of the active window

C#	
	<pre>//capture a region in the active Window  //define the capture Region JRCapture.CaptureRegionHeight = 400; JRCapture.CaptureRegionLeft = 300; JRCapture.CaptureRegionTop = 200; JRCapture.CaptureRegionWidth = 400;  //activate the region capture tool JRCapture.CaptureRegion = true; PictureBox1.Image = JRCapture.CaptureWin(); //deactivate the region capture tool JRCapture.CaptureRegion = false;</pre>

VB.Net	<pre>'capture a region in the active Window  'define the capture Region JRCapture.CaptureRegionHeight = 400 JRCapture.CaptureRegionLeft = 300 JRCapture.CaptureRegionTop = 200 JRCapture.CaptureRegionWidth = 400  'activate the region capture tool JRCapture.CaptureRegion = True PictureBox1.Image = JRCapture.CaptureWin 'deactivate the region capture tool JRCapture.CaptureRegion = False</pre>
--------	--

### Or copy an area of an object in use of the handle

C#	<pre>//capture a region of an Object or Window by his handle  //define the capture Region JRCapture.CaptureRegionHeight = 50; JRCapture.CaptureRegionLeft = 5; JRCapture.CaptureRegionTop = 5; JRCapture.CaptureRegionWidth = 50;  //activate the region capture tool JRCapture.CaptureRegion = true; PictureBox1.Image = JRCapture.CaptureByHWND((long)your.Handle); //deactivate the region capture tool JRCapture.CaptureRegion = false;</pre>
----	---

VB.Net	<pre>'capture a region of an Object or Window by his handle  'define the capture Region JRCapture.CaptureRegionHeight = 50 JRCapture.CaptureRegionLeft = 5 JRCapture.CaptureRegionTop = 5 JRCapture.CaptureRegionWidth = 50  'activate the region capture tool JRCapture.CaptureRegion = True PictureBox1.Image = JRCapture.CaptureByHWND(your.Handle) 'deactivate the region capture tool JRCapture.CaptureRegion = False</pre>
--------	--

## JRCapture licensing:

Use the following settings

C#	
	JRCapture.SerialNumber = 0;
	JRCapture.RegCode = 0;

VB.Net	
	JRCapture.SerialNumber = 0
	JRCapture.RegCode = 0
